### WARNINGS

How to Calculate the temperature of the water in the first dough:

This method is correct if you have a kneader with dipping arms, if alternatively you have a spiral mixer, keep in mind that the same tends to heat the dough a lot, thus reduce the water temperature by at least 5°C.

In order to obtain the correct final temperature of the dough, let's assume 26° C, follow the diagram below.

It will be necessary to know and then measure 3 values:

- 1) the value of the ambient temperature
- 2) the temperature value of the Dolce Forno
- 3) the value defined in function of the mixer used (plunger 15, spiral or planetary mixer 20).

CALCULATION: Final Temperature  $26^{\circ}\text{C} \times 3$  (fixed number) = 78 - value 1 (e.g.  $20^{\circ}\text{C}$ ) - value 2 (e.g.  $18^{\circ}\text{C}$ ) - value 3 (e.g. 15) =  $78-20-18-15 = 25$  which will be the temperature of the water in the first mixture using a dipper
